

## Genetic Resource Arboretum

Representative genetic resources collected in the forest tree breeding project and the forest tree gene bank project are exhibited in four sections:

The "Genetic resources as breeding materials" section features new varieties selected through the forest tree breeding project.

The "Genetic Resources of natural monuments etc." section features natural monuments and endangered species which are collected across Japan.

The "Genetic resources in Japan" section features major tree species from Hokkaido to Okinawa.

The "Genetic resources of the world" section features forest tree species which are distributed throughout the world such as cedar, cypress, beech and others.
