

# **Termites of the Genus *Reticulitermes* of Japan and Taiwan**

By

Katsura MORIMOTO<sup>(1)</sup>

There are two opinions on the taxonomy of the genus *Reticulitermes* of Japan and Taiwan, namely, that there are two species from Japan and Taiwan proposed first by OSHIMA (1908) and supported by LIGHT (1931), KOIDZUMI (1921) and SNYDER (1949), or that there is only one species from there treated by YANO (1910), HOLMGREN (1912, 15), HOZAWA (1915) and AHMAD (1958).

So far as the author's present investigation goes, four species of the genus are confirmed from the named regions as noted in this paper.

Taxonomic characters treated in this paper are enumerated here.

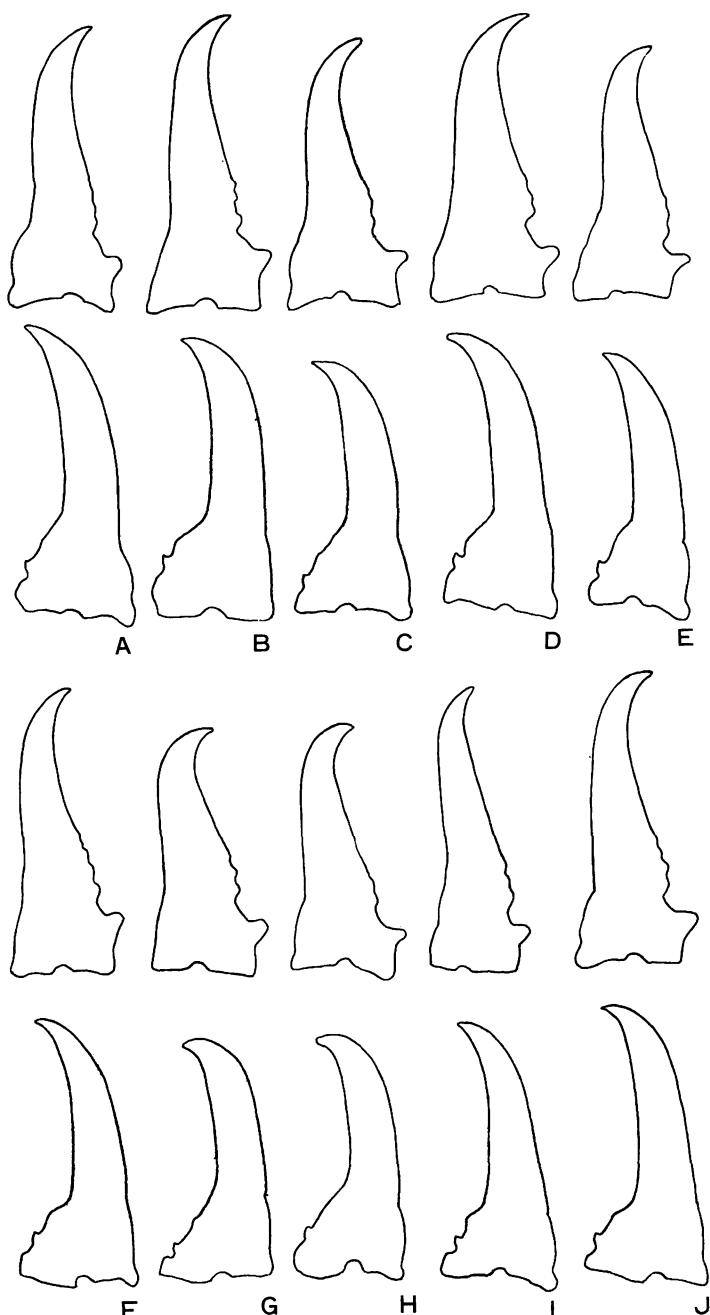

## **Taxonomic characters : Soldier (Fig. 1)**

1. Length of head with mandible (A~F). Position of the mandibles are not stable in alcoholic specimens, but most of them take a position as illustrated in Fig. 1.
2. Length of head to the tip of labrum (B~F). Many specimens have a labrum oblique rightwards to the mesial line of head in position.
3. Length of head to the anterior of clypeus (C~F). Anteclypeus is membranous and very often deeply retracted under postclypeus.
4. Length of head to the anterior margin of frons (D~F), measured on the mesial line.  
This is the most reliable length of head.
5. Distance of fontanelle (E~F).
6. Maximum width of head (G~H).
7. Length of right mandible from the basal outer angle to the tip.
8. Length of left mandible.
9. Number of antennal segments.
10. Length of gula (M~N).
11. Maximum width of gula (I~J).
12. Minimum width of gula (K~L).
13. Length of metafemur.
14. Length of metatibia.
15. Length of labrum (O~P), from the hyaline tip to the posterior margin of brownish sclerotic area measured on the mesial line.  
Present method of measurement is said practical in view of the fact that the real basal margin of labrum is very often covered by anteclypeus and invisible from dorsal side in many specimens.
16. Maximum width of labrum (Q~R).

---

Fig. 10. Winged-form head.

4. Length of head to the anterior margin of frons (A~C).
5. Length of head to the anterior margin of labrum (A~D).
6. Maximum width of head without eye (E~F).
7. Length of clypeus (G~H).
8. Maximum width of clypeus (J~K).
9. Length of labrum (H~I).
10. Length of gula.
11. Width of gula.
12. Maximum diameter of compound eye with ocular sclerite (L).
13. Maximum diameter of compound eye without ocular sclerite.
14. Minimum eye-ocellus distance (M).
15. Number of antennal segments.
16. Width of pronotum.
17. Maximum length of pronotum.
18. Length of protibia.
19. Length of metatibia.
20. Length of fore wing with scale.
21. Width of fore-wing.
22. Number of Cu-branches of fore-wing, without sub-branch.
23. Number of specimens examined.
24. Head index I (4/6).
25. Head index II (5/6).
26. Pronotum index (17/16).
27. Fore-wing index (21/20).
28. Compound-eye sclerite index (12~13/12).
29. Coloration of head.
30. Setal density on head (Fig. 10).
31. Shape of pronotum.
32. Coloration of pronotum (Tab. 4).

After the examination of these characters, it becomes clear that the following characteristics are the most important for the separation of species and subspecies.

Soldier : General shape of head, convexity of frons, shape of labrum, presence and the length of setae on labrum and clypeus, curvature of mandible, shape of gula.

Winged form : General shape of head, coloration of gula and circumgular regions.

Results of the measurement are enumerated in Table 1~3.

### Key to species and subspecies

#### **Soldier**

- 1 : Labrum subspiniform at tip. Frontal area not raised. Head parallel-sided.  
.....*chinensis* SNYDER
- 1' : Labrum lanceolate or rounded at tip. Frontal area more or less raised. .... 2
- 2 : Head with the lateral sides straight and tapering posteriorly. Gula slender, gular index I less than 0.3. Mandibles curved stringly at tip. ...*miyatakei* sp. nov.
- 2' : Head parallel-sided or tapering anteriorly from the broadest portion a little behind the

Okinawa, Gogasan	20	-	-	-	-

I : Pronotum entirely yellow.

II : Pronotum yellow with a pair of small transverse patches.

III : Pronotum yellow with a pair of large transverse patches.

IV : Pronotum dark brown with a yellowish cruciform patch.

V : Pronotum entirely brownish.

- middle. Gula broader, gular index I more than 0.3..... 3
- 3 : Labrum slender, with long paraterminal setae ..... *flaviceps* OSHIMA..... 4
- 3' : Labrum without paraterminal setae or the setae minute..... *speratus* KOLBE ..... 5
- 4 : Right mandible with the inner margin straight and curved inwards at tip  
..... *flaviceps flaviceps* OSHIMA
- 4' : Right mandible with the inner margin gently curved ..... *flaviceps amamianus* subsp. nov.
- 5 : Labrum broader, labral index less than 1.2 in average ..... 6
- 5' : Labrum slenderer, labral index more than 1.2 in average ..... 7
- 6 : Setae on labrum and clypeus longer in general. Labrum subpentagonal, subangulate at the broadest point. Frontal convexity slightly weaker.  
..... *speratus kyushuensis* subsp. nov.
- 6' : Dorsal setae of labrum and clypeal setae absent or minute. Sides of labrum rounded.  
Frontal convexity a little stronger ..... *speratus speratus* KOLBE
- 7 : Sides of labrum weakly concave before the broadest portion. Head broadest a little behind the middle and tapering thenceforth ..... *speratus okinawanus* subsp. nov.
- 7' : Sides of labrum convex ..... 8
- 8 : Head with the sides more or less rounded, broadest behind the middle. Head index more than 0.65 in average ..... *speratus leptolabralis* subsp. nov.
- 8' : Head parallel-sided. Head slenderer, head index less than 0.65 in average, much paler  
..... *speratus yaeyamanus* subsp. nov.

#### **Winged form**

To separate the winged form of *speratus* into subspecies presents difficulties. Winged form of *chinensis* and *miyatakei* remains unknown to the author.

- 1 : Gula and circumgular area same color as pronotum, yellowish. Setae on head a little closer and longer ..... *flaviceps flaviceps* OSHIMA
- 1' : Gula and circumgular area same color as cranium, blackish brown. Setae on head a little shorter and sparser ..... *speratus* KOLBE

#### **1. *Reticulitermes chinensis leptomandibularis* HSIA & FANG**

*Reticulitermes chinensis leptomandibularis* HSIA & FANG, Acta Ent. Sinica 14 (4) : 375. 1965  
Specimens examined : Wulai near Taipei, 27. V. 1965, K. MORIMOTO leg. (Soldiers and workers).

Distribution : China. Taiwan (New record).  
These specimens well fit the description of *chinensis leptomandibularis* given by HSIA and FANG.

#### **2. *Reticulitermes miyatakei* sp. nov.**

Type colony : Santaro-toge. Amami-Oshima, 2. XI. 1966, Y. MIYATAKE leg. (Soldiers and workers). Paratypes : Ohara. Tokunoshima, 8. XI, 1966, Y. MIYATAKE leg. (Soldiers and workers).

Distribution : Amami-Oshima, Tokunoshima.  
Soldier : Head with the lateral sides straight and tapering to the broadly rounded posterior side. Frontal area weakly convex. Mandibles strongly curved inwards at tip like *curvatus*. Labrum broader, labral index 1.0~1.21, dorsal setae short in general, rarely long. Clypeal setae short. Gula slender, gular index I less than 0.3 in average.

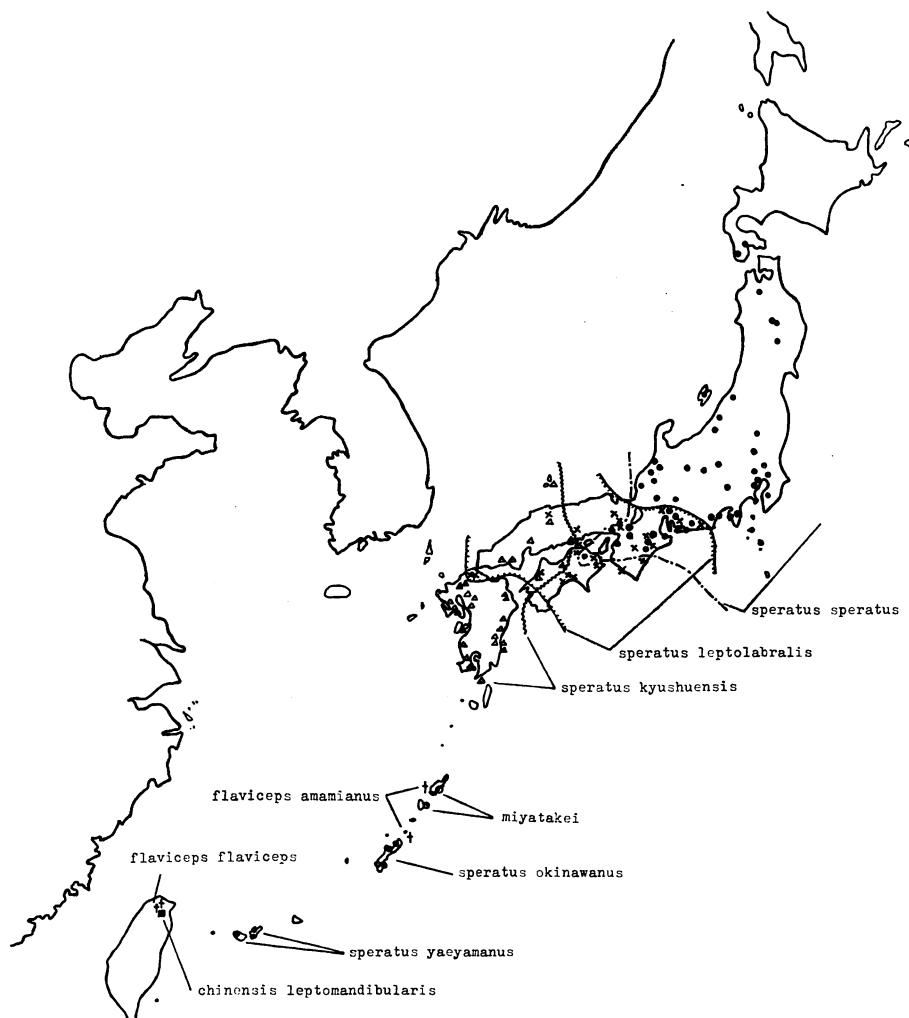

Fig. 11 Distribution map.

Winged form : unknown.

This species is similar to *curvatus* HSIA & FANG, 1965, from China, having strongly curved mandibles at tip, but may easily be separable from it by the shape of head, smaller body and broader labrum. This is also similar to *clypeatus* LASH, 1951, from Jerusalem, having the broadest head in front, but the mandibles curved more strongly and the head distinctly larger.

### 3. *Reticulitermes flaviceps* OSHIMA

*Termes speratus* : OSHIMA, Zool. Mag. XX : 514, 1908

*Leucotermes speratus* : SHIRAKI, Trans. Ent. Soc. Japan II : 230, 1909

*Termes (Leucotermes) flavipes* : OSHIMA, First Offic. Rep. : 30, 1909 ; Zool. Mag. XXII : 345, 1910

*Leucotermes flavipes* : OSHIMA, Second Offic. Rep. : 3, 1911

*Termes flaviceps* : OSHIMA, Ins. World XV : 356, 1911

*Leucotermes flaviceps* : OSHIMA, Third Offic. Rep. : 74, 1912 ; Philipp. J. Sci. D, VIII : 277, 1913 *Reticulitermes flaviceps* : LIGHT, Lingnan Sci. J. 7 : 589, 570, 1929 - Snyder, Smithson. Misc. Coll. 112 : 72, 1949

*Leucotermes speratus* : HOLMGREN, Annot. Zool. Jap. VIII : 124, 1912 (partim)

*Leucotermes (Reticulitermes) speratus* : HOLMGREN, K. Svenska Vetensk. Handlingar. 50 : 61, 1913 (partim) - HOZAWA, J. Coll. Imp. Univ. Tokyo XXXV (7) : 62, 1915 (partim)

*Reticulitermes speratus* : Ahmad, Biologia 4 : 71, 72, 1958 (partim) - TSAI & CHEN, Economic Ins. China VIII Termites : 60, 1964 (partim)

Soldier : Head slenderer, parallel-sided or slightly narrowed anteriorly. Labrum slender, labral index 1.21~1.46, paraterminal setae long. Clypeal setae long. Pronotum with the posterior margin weakly notched at the middle.

Winged form (based on the dealate two pairs taken at Yangmingshan) : Head with the gular and circumgular regions same color as pronotum, yellowish. Head with setae a little longer and closer than in *speratus*. Pronotum with the posterior margin weakly notched at the middle.

### 3A. *Reticulitermes flaviceps flaviceps* OSHIMA

Specimens examined : Sokei, Taipei Hsien, 17. VI. 1964, S. ITO leg. (Soldiers, Workers). Chikushiko, Taipei Hsien, 24. VI. 1964, S. ITO leg. (Soldiers, Workers). Yomeisan (Yangmingshan), Taipei Hsien, 21. VI. 1964, S. ITO leg. (Soldiers, Workers); 25. V. 1965, K. MORIMOTO leg. (2 Male, 2 Female, Soldiers, Workers).

Distribution : Taiwan

Soldier : Inner margin of the right mandible straight and curved inwards at tip. Head longer, subparallel or slightly tapering anteriorly.

This subspecies was first identified by OSHIMA (1908) as *speratus*, and OSHIMA (1909) changed his opinion and reported it as *flavipes*. OSHIMA (1911) gave a new name, *flaviceps*, to the common termite in Taipei and described it in Japanese together with the comparison of Taiwan species with true *flavipes*. OSHIMA (1912) described *flaviceps* as a new species from Botel-Tobago or Kashoto, a small island south-east off Taiwan, but said nothing about his *flaviceps* from Taipei. OSHIMA (1912) published another report on termites from the Bureau of Railways, of which the contents are the same as his third official report on termites, except the following statement on termite from Taipei that the common termite in Taipei is closer to *flaviceps* than to *speratus*.

According to the principle of priority in Zoological Nomenclature, *Termitess flaviceps* OSHIMA (1911) based on "common termite" from Taipei is the valid original description, and *flaviceps* OSHIMA (1912) from Botel-Tobago is a synonym of it.

*R. flaviceps* of OSHIMA from Botel-Tobago seems to be a little different from that of Taipei judging from the comparison of the descriptions given by OSHIMA and presumable to the author that it has a close relation to *fukienensis* or *speratus yaeyamanus* rather than to *flaviceps* of Taipei.

LIGHT (1931) distinguished the adult of *fukienensis* from *flaviceps* by the coloration of pronotum as follows :

*flaviceps* and *speratus* : Pronotum yellow, without pigmented area.

*fukienensis* : Pronotum yellow but with scattered pigmented spots.

This character is, however, rather variable in *speratus* as shown in Table 4, and seems to

be insufficient for the separation of species on it.

This subspecies is much closer to *fukienensis* than to *speratus*.

### 3B. *Reticulitermes flaviceps amamianus* subsp. nov.

Type colony : Yuwandake, Amami-Oshima, 4. XI. 1966, Y. MIYATAKE leg. (Soldiers, Workers). Paratypes : Yoron Is. 17. I. 1964, M. SAKAE leg. (Soldiers, Workers).

Distribution : Amami-Oshima, Yoron Is.

Soldier : Head tapering anteriorly from the broadest portion a little behind the middle. Right mandible with the inner margin gently curved.

Winged form : unknown.

### 4. *Reticulitermes speratus* KOLBE

*Termes speratus* KOLBE, Berl. Ent. Zschr. XXIX : 147, 1885 - MATSUMURA, Thous. Ins. Jap. I : 24, 1904 ; Konchu Bunruigaku : 188, 1908 - OSHIMA, Zool. Mag. XX : 514, 1908 (partim) ; Ins. World XV : 356, 1911

*Termes (Leucotermes) speratus* : DESNEUX, Gen. Ins. Isoptera : 33, 1904

*Termes flavipes* : OSHIMA, Zool. Mag. XX : 515, 1908

*Leucotermes flavipes* : SHIRAKI, Trans. Ent. Soc. Japan II : 230, 1909

*Leucotermes speratus* : OSHIMA, Zool. Mag. XXII : 414, 1910 ; Third Offic. Rep. : 71, 1912 ; PHILIPP. J. Sci. D, VIII : 277, 1913 - Nawa, Ins. World XIV : 547, 1910 ; Ins. World XVI : 17, 1912 - YANO, Ins. World XIV : 601, 1910 ; Zool. Mag. XXII : 354, 1911 ; Rep. Forest Exp. Sta. 10 : 109, 1913 - HOLMGREN, K. Svenska Vetensk. Handlingar. 46 : 69, 1911 ; Annot. Zool. Jap. VIII : 124, 1912 (partim)

*Leucotermes (Reticulitermes) speratus* : HOLMGREN, K. Svenska Vetensk. Handlingar. 50 : 61, 1913 - HOZAWA, J. Coll. Sci. Imp. Univ. Tokyo XXXV (7) : 62, 1915 (partim).

*Reticulitermes speratus* : LIGHT, Lingnan Sci. J. : 589, 1929 - SNYDER, Smithson. Misc. Coll. 112 : 74, 1949 - AHMAD, Biologia 4 : 71, 72, 1958 (partim) - TSIA & CHEN, Economic Ins. China VIII Termites : 60, 1964 (partim).

*Reticulitermes flaviceps* : HSIA & FANG, Acta Ent. Sinica 14 : 363, 1965

Soldier : Head with the frontal area distinctly convex. Labrum without paraterminal setae and blunt at tip. Head parallel-sided or broadest behind the middle.

Winged form : Gula same color as cranium, blackish brown. Head with setae sparser and shorter. Pronotum yellow, very often with brownish patches (see Table 4).

This species has a wide range of distribution from Hokkaido to China, and Japanese species is separable into five subspecies as described below.

### 4A. *Reticulitermes speratus speratus* KOLBE

Specimens examined : see Table 3.

Distribution : Hokkaido to Kinki District of Honshu, Kagawa.

Soldier : Head with the frontal area distinctly convex. Labrum subovate with round tip, labral index 1.0~1.2, dorsal setae absent or minute. Clypeal setae absent or minute.

Specimens taken from Hokkaido, Nagano, Morioka and Mt. Fuji have a broader labrum with broad tip. Several colonies taken from Aichi and Mie Prefectures are regarded as an intermediate between *speratus speratus* and *speratus leptolabralis*.

4B. *Reticulitermes speratus leptolabralis* subsp. nov.

Type colony : Yami, Tokushima City, 14. V. 1966, M. KIUCHI leg. (Winged forms, Soldiers and Workers). Paratypes : see Table 3. Distribution : Iwata City to Kokura City.

Soldier : Head similar to *speratus speratus*. Labrum slender, labral index 1.15~1.39, more than 1.2 in average. Dorsal setae of labrum and clypeal setae minute or absent.

4C. *Reticulitermes speratus kyushuensis* subsp. nov.

Type colony : Kashii, Fukuoka City, 29. IV. 1966, S. MIYAMOTO leg. (Soldiers, Workers and Winged forms). Paratypes : see Table 3.

Distribution : Okayama to Kyushu.

Soldier : Head slightly darker than the other subspecies of *speratus* in general, frontal convexity weaker. Labrum subpentagonal, subangulate at the broadest point a little behind the middle, labral index 1.0~1.23, less than 1.2 in average. Dorsal setae of labrum and clypeal setae longer.

One colony taken from Matsuyama may be an intermediate between *speratus speratus* and *speratus kyushuensis* having labrum similar to the former in shape, but the arrangement of setae is to the latter. Three colonies from Miyazaki and Kagoshima have a somewhat more slender labrum than the typical one (labral index more than 1.2 in average), but the shape and the setal arrangement of labrum reveal the consubspecific with it.

4D. *Reticulitermes speratus okinawanus* subsp. nov.

Type colony : Yona, Okinawa, 21. V. 1965, K. MORIMOTO leg. (Soldiers, Workers). Paratypes : see Table 3.

Distribution : Okinawa

Soldier : Labrum slender, labral index 1.17~1.41, more than 1.3 in average. Sides of labrum weakly concave before the broadest portion. Dorsal setae of labrum and clypeal setae short.

4E. *Reticulitermes speratus yaeyamanus* subsp. nov.

Type colony : Shirahama, Iriomote, 4. X. 1963, K. MORIMOTO leg. (Soldiers, Workers). Paratypes : see Table 3.

Distribution : Iriomote, Ishigaki.

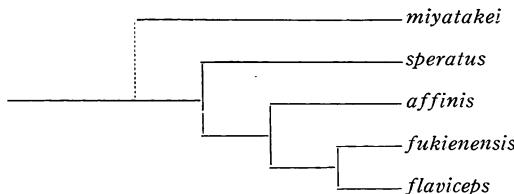

Soldier : Head pale, whitish, only the anterior part brownish. Head parallel-sided, slender, head index less than 0.65. Labrum slender, labral index 1.14~1.42, more than 1.2 in average.

### Phylogenetic consideration

Up to the present time twenty species of the genus *Reticulitermes* have been recorded from the temperate regions of the northern hemisphere, and the distribution of species with yellow pronotum in the adult restricted to China, Taiwan and Japan. They are *affinis* HSIA & FANG from Chekiang to Kwangtung, *fukienensis* LIGHT from Anhwei to Kwangtung, *flaviceps* OSHIMA from Taiwan, and *speratus* KOLBE from Japan and the major part of China from Shantung to Yunnan. *R. fukienensis*, *affinis* and *flaviceps* have a close relationship with one another in having slenderer and parallel-sided head and labrum with paraterminal setae. *R. fukienensis* and *flaviceps* are very close to each other, and could possibly be treated as conspecific, but *affinis* is much larger.

Comprehensive consideration of the present distribution of the named species leads to the conclusion that *speratus* migrated probably into Japan via Corea from the north, and *flaviceps* (including *fukienensis*) from southern China to Taiwan. After the separation of Japan, Ryukyus and Taiwan into islands, *speratus* differentiated into subspecies and *flaviceps* differentiated from continental *fukienensis*.

Relationship of these species may be illustrated as follows :

# ヤマトシロアリ属の分類学的研究

森 本 桂<sup>(1)</sup>

## (摘要)

日本および台湾のヤマトシロアリ属については、分類学上2つの意見があった。その1つは大島(1921)らによるもので、同属の2種が存在するとされており、他の1つは矢野(1910)らによるもので、1種のみが存在するとされていた。

その後、世界各地の同属の種が再検討されて、多くの種に分けられているが、日本においては久しい間研究が行なわれていなかった。たまたま、シロアリの被害現地において、加害習性の異なるヤマトシロアリがみられたことから、筆者はヤマトシロアリ属の再検討を行ない、日本および台湾には4種が存在し、そのうち2種は、さらに亜種に分けられることを確かめた。

この報告では、ヤマトシロアリ属の研究史、兵蟻および有翅虫についての分類上の特徴ならびに種と亜種の検索について述べ、アマミシロアリ(新種)の記載のほか、キアシシロアリには1新亜種を、ヤマトシロアリには4新亜種を記載して整理し、上記の結論にいたった経過を明らかにするとともに、それらの類縁関係についても論じた。

日本および台湾における種・亜種とその分布は次のとおりである。

1. *Reticulitermes chinensis leptomandibularis* HSIA & FANG トガリシロアリ(新称)〔台湾(新記録)〕
2. *R. miyatakei* MORIMOTO, sp. nov. アマミシロアリ(新称)〔奄美大島〕
3. *R. flaviceps* OSHIMA キアシシロアリ
  - (A) *R. flaviceps flaviceps* OSHIMA〔台湾〕
  - (B) *R. flaviceps amamianus* MORIMOTO, subsp. nov. 〔奄美大島、与論島〕
4. *R. speratus* KOLBE ヤマトシロアリ
  - (A) *R. speratus speratus* KOLBE 〔北海道から近畿地方まで、香川県〕
  - (B) *R. speratus leptolabralis* MORIMOTO, subsp. nov. 〔静岡県磐田市以西～北九州門司・小倉まで、四国〕
  - (C) *R. speratus kyushuensis* MORIMOTO, subsp. nov. 〔岡山県鷺羽山以西の中国地方、九州、松山市〕
  - (D) *R. speratus okinawanus* MORIMOTO, subsp. nov. 〔沖縄本島〕
  - (E) *R. speratus yaeyamanus* MORIMOTO, subsp. nov. 〔石垣島、西表島〕
